

1. PROTECTION OF THE CLOSEST OBJECTS

Acid solutions are used to clean the traces of grout and adhesive after the floor fixing. For that reason the closest objects which could be damaged by the acids, like metallic furniture or with chromium-plated parts, must be removed or protected.

To avoid the attack of the chemical fumes to the closest objects, apart of the protection, we suggest airing the room where the cleaning is taking place to avoid condensations of the acid solution.

2. CLEANING PROCEDURE OF THE FIXING TRACES

This cleaning procedure with acid pH chemical agents must only be carried out when the cleaning procedure with neutral pH was not successful.

Before proceeding with the cleaning, it is a must to divide the cleaning area in sections, as the cleaning must be carried out in parcels of 2 Sqm. Not all the area can be cleaned at the same time. When one of the sections of 2Sqm is clean, it is the moment to start cleaning another section of 2 Sqm.

A hydrochloric acid diluted at 3%, HCl is used for the cleaning.

Spray the hydrochloric acid diluted at 3% and spread it with a sponge on the first 2 square meters. Let it settle for 30 seconds, then rinse the area with abundant water using a mop. Repeat in the following section of 2 Sqm.

3. MAINTENANCE

In the usual cleaning, it is possible to use a traditional method, as can be the mop, but always using neutral pH cleaning products.
